PART I
INTRODUCTION

INTRODUCTION

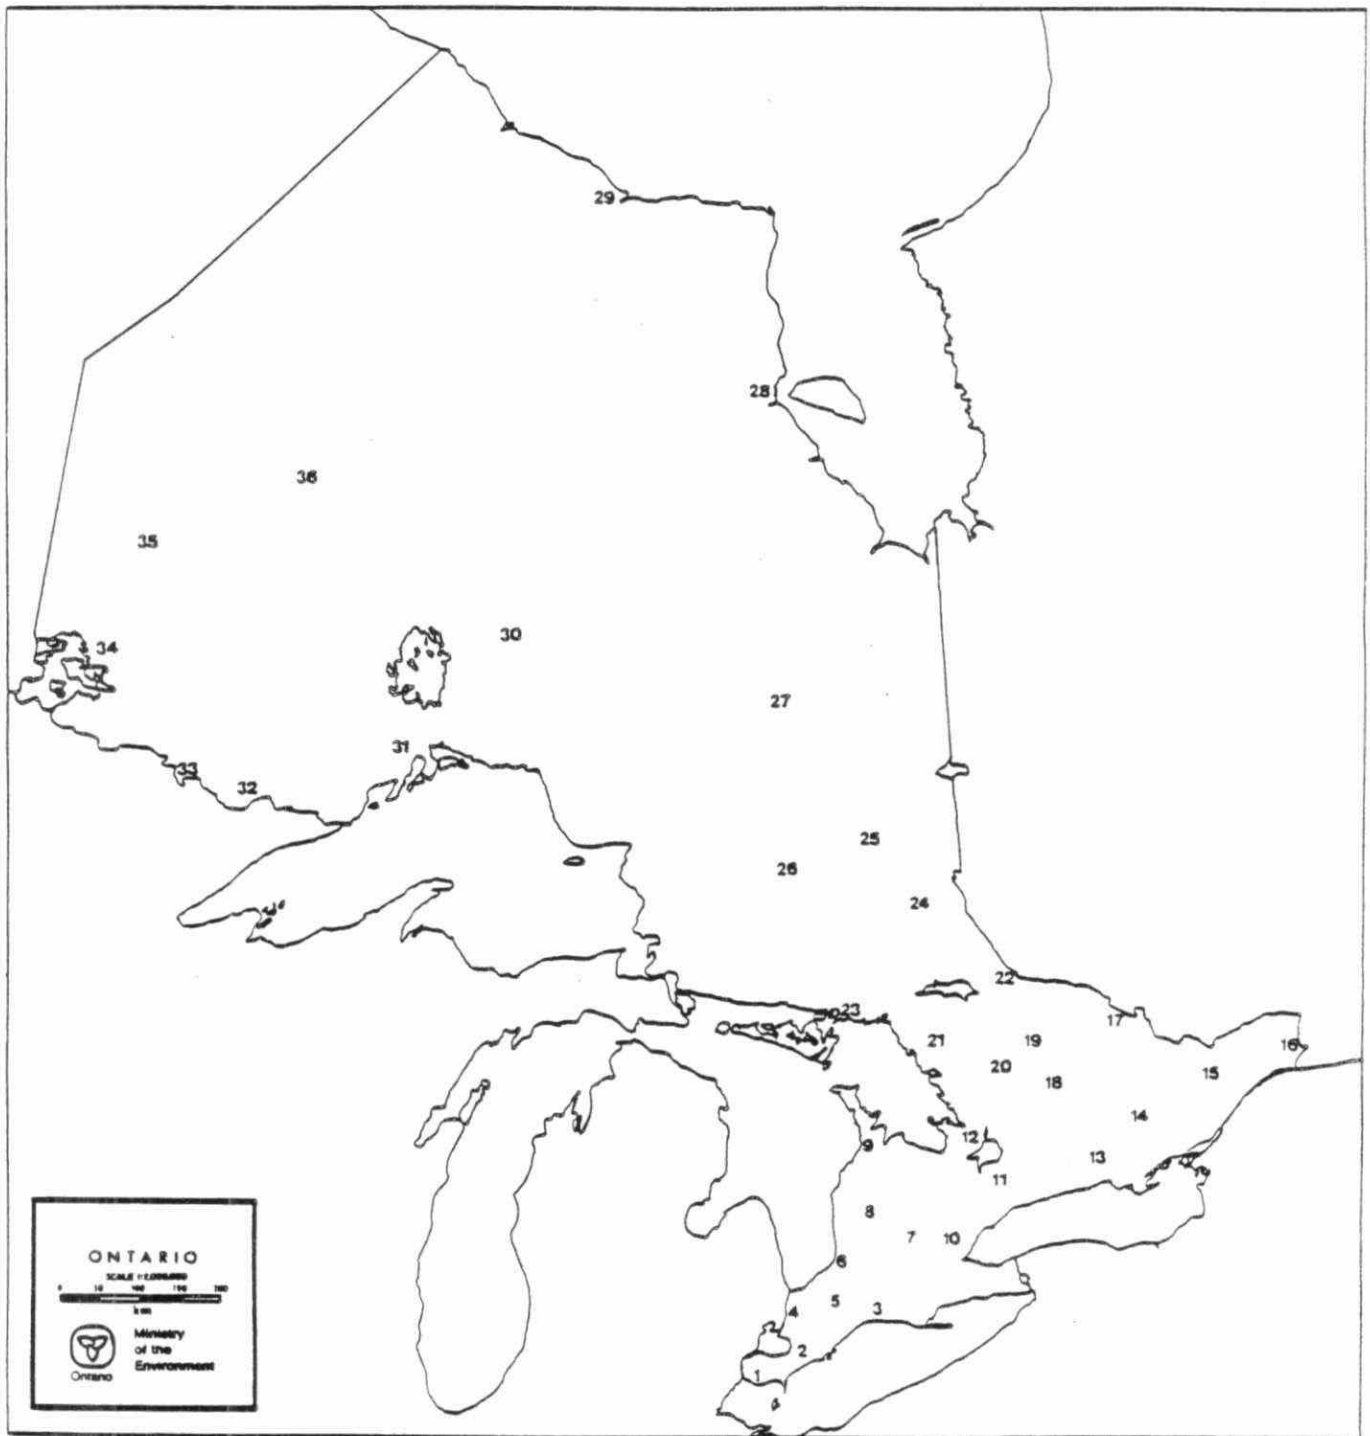

This report was prepared by Walter Chan and David Chung. The statistical summaries presented in this report pertain to the 1982 analytical results obtained from the Acidic Precipitation in Ontario Study (APIOS) cumulative precipitation monitoring network (see network overview report, #ARB-164-83-ARSP). The relevant data are listed in a previous report, #ARB-74-84-ARSP. At the inception of the network, the period of collection was monthly, however, a 28-day accumulation period was adopted as of January 5, 1982. All available data are utilized in the calculations except results reported as being unreliable or approximate. If it is noted that the actual result is greater than the reported value due to exceedance of upper analytical limit, then the reported value is also excluded. Reported results for metals which have missing leachate analysis are also excluded from statistical analysis. Results labelled as <W are replaced by "zero". If a detection limit (<or<T) is reported, a value corresponding to one half the detection limit is utilized for statistical calculations as reported in the statistical summaries. The reported cumulative precipitation gauge depth (or Environment Canada's CLIMAT result) is utilized in the calculation of deposition. If a precipitation gauge value is not available, then the collected sample volume is converted to its equivalent precipitation depth and is used in the deposition calculation.

The statistical summaries presented in Parts III to VI include number of samples, mean (arithmetic/geometric), standard deviation (arithmetic/geometric), maximum, minimum, quartiles and precipitation weighted means using precipitation gauge depths where appropriate. These statistics are for an average sampling period. Data given in the listing report (#ARB-74-84-ARSP) which correspond to irregular sampling periods are either combined if they are from consecutive collection periods which span $28d \pm 5d$ or deleted, if otherwise, before the statistics are generated.
